Received 5 April 2009; accepted 11 May 2009
Key indicators: single-crystal X-ray study; $T=295 \mathrm{~K}$; mean $\sigma(\mathrm{C}-\mathrm{C})=0.005 \AA$; $R$ factor $=0.031 ; w R$ factor $=0.083 ;$ data-to-parameter ratio $=22.1$.

The centrosymmetric title complex, $\left[\mathrm{Ni}\left\{\mathrm{S}_{2} \mathrm{P}\left(\mathrm{OC}_{2} \mathrm{H}_{5}\right)_{2}\right\}_{2}\right]$, has been redetermined using area-detector data. The central $\mathrm{Ni}\left(\mathrm{S}_{2} \mathrm{P}\right)_{2}$ core is essentially planar and confirms the early results of McConnell \& Kastalsky [Acta Cryst. (1967), 22, 853859] based on multiple film technique data. In the title structure, the standard uncertainty values are approximately seven times lower and all H -atom positions are calculated. A pair of short symmetry-related $\mathrm{H} \cdots \mathrm{H}$ contacts with distances of $2.33 \AA$ is observed in the crystal structure.

# Redetermination of $\operatorname{bis}\left(O, O^{\prime}\right.$-diethyl dithiophosphato- $\left.\kappa^{2} S, S^{\prime}\right)$ nickel(II) 

Damian Paliwoda, Jarosław Chojnacki, Anna Mietlarek-Kropidłowska and Barbara Becker

## S1. Comment

We are interested in metal complexes with sulfur rich kernel (Kropidłowska, Chojnacki, et al., 2008). Recently, we turned our attention to dithiophosphates and among others to the nickel(II) complexes with widely used diethyldithiophosphate ligand (DEDTP). We prepared the title $\mathrm{Ni}(\mathrm{DEDTP})_{2}$ complex and redetermined its structure. The nickel atom of $\mathrm{Ni}(\text { DEDTP })_{2}$ molecule (Fig. 1) occupies a crystallographic inversion centre and shows a square planar geometry, which was also observed previously by Fernando \& Green (Fernando \& Green, 1967; NIETHP01) and McConnell \& Kastalsky (McConnell \& Kastalsky, 1967; NIETHP), who used multiple film technique data for the structure determination. For NIETHP01 ( $R=15.7 \%$ ) the average distances and angles within four-membered $\mathrm{NiS}_{2} \mathrm{P}$ chelate ring were given as $\mathrm{Ni}-\mathrm{S}$ 2.21 (1) $\AA, \mathrm{P}-\mathrm{S} 1.97$ (2) $\AA, \mathrm{S} 1 — \mathrm{Ni}-\mathrm{S} 288^{\circ}$, and S1—P—S2 $103^{\circ}$. More precise values were reported for NIETHP $(R$ $=11.5 \%$ ) with the following distances and angles within chelate $\mathrm{NiS}_{2} \mathrm{P}$ ring: $\mathrm{Ni}-\mathrm{S} 12.230$ (4) $\AA$, $\mathrm{Ni}-\mathrm{S} 22.236$ (4) $\AA$, S1 —P 1.986 (6) Å, S2—P 1.993 (5), S1—Ni—S2 88.5 (1) ${ }^{\circ}$ and S1—P—S2 103.1 (2) ${ }^{\circ}$.
These may be compared to the present data - respective values are given in Table 2. Note almost identical bond lengths for the pairs of $\mathrm{Ni}-S$ and $S-\mathrm{P}$ bonds. The redetermination was done at room temperature and the structure was refined with a crystallographic reliability of $R=3.06 \%$. Although the overal picture did not change significantly, the precision of the present data is much higher. Lighter atoms (C, O) are well fixed, standard uncertainty values are approximately seven times lower than those of reported NIETHP and NIETHP01 structures and all H -atom positions are calculated.
In general, $\mathrm{Ni}-\mathrm{S}$ bond lengths in several nickel(II) dialkyldithiophosphates, $\left[\mathrm{Ni}\left(\mathrm{S}_{2} \mathrm{P}\{\mathrm{OR}\}_{2}\right)_{2}\right]$ are quite similar. Those
 (Ivanov et al., 2004, IBAQAE), ${ }^{i} \operatorname{Pr}(2.216$ (1) and 2.227 (1) Å) (Tkachev \& Atovmyan, 1976, IPDTPN, Hoskins \& Tiekink, 1985, IPDTPN01) and ${ }^{i} \mathrm{Bu}(2.218$ (1) - 2.231 (1) $\AA$ ) (Ivanov et al., 2004, IBAQEI) are within 2.218-2.235 $\AA$ range. Also $\mathrm{S}-\mathrm{P}$ bond lengths change only slightly and all are within 1.98-2.00 $\AA$. Crystals of $\mathrm{Ni}(\mathrm{DEDTP})_{2}$ consist of discrete units of the complex (Fig. 2) and besides short intermolecular C3-H3B $\cdots \mathrm{H} 3 \mathrm{~B}-\mathrm{C} 3$ contact between the symmetry related molecules ( $\mathrm{H} \cdots \mathrm{H}$ distance equals $2.33 \AA$, see Fig. 3) there are no other interactions. Although the above mentioned contact is comparable with the sum of two hydrogen atoms van der Waals radii $(2.4 \AA)$ there is no reason to consider it as a weak hydrogen bond (Steiner \& Desiraju, 1998). None of the aforementioned nickel(II) dialkyldithiophosphates show such $\mathrm{C}-\mathrm{H} \cdots \mathrm{H}-\mathrm{C}$ nonbonding interactions although for di(iso-butyl)dithiophosphate (Ivanov et al., 2004) the existence of weak $\mathrm{C}-\mathrm{H} \cdots \mathrm{S}$ hydrogen bonds may be envisaged.

## S2. Experimental

Nickel chloride, $\mathrm{NiCl}_{2} \times 6 \mathrm{H}_{2} \mathrm{O}(0.60 \mathrm{~g} ; 0.0025 \mathrm{~mol}$; POCh$)$ was dissolved in 30 ml me thanol/water $(10 / 1, v / v)$ and added dropwise to the solution of ammonium salt of diethyldithiophosphate ( $1.02 \mathrm{~g} ; 0.005 \mathrm{~mol}$; Aldrich) in 20 ml me thanol/water $(10 / 1, v / v)$. The mixture was stirred vigorously for one hour. The solution was then filtered off and the filtrate was left for crystallization at room temperature. After one day well shaped, violet prismatic crystals suitable for

X-ray analysis were collected. Then, the mother liquor was concentrated and after few days more product was isolated. The overall yield was c.a. $\sim 90 \%$.

## S3. Refinement

All H atoms were placed in calculated positions and refined as riding on their carrier atoms with respective $U_{\text {iso }}(\mathrm{H})$ values: $\mathrm{C}-\mathrm{H}=0.96 \AA\left(\mathrm{CH}_{3}\right)$ and $U_{\text {iso }}(\mathrm{H})=1.5 U_{\text {eq }}(\mathrm{C}), \mathrm{C}-\mathrm{H}=0.97 \AA\left(\mathrm{CH}_{2}\right)$ and $U_{\text {iso }}(\mathrm{H})=1.2 U_{\text {eq }}(\mathrm{C})$.

## Special details

Experimental. Oxford Diffraction Ltd., 2008. Empirical absorption correction using spherical harmonics, implemented in SCALE3 ABSPACK scaling algorithm.
Geometry. All e.s.d.'s (except the e.s.d. in the dihedral angle between two l.s. planes) are estimated using the full covariance matrix. The cell e.s.d.'s are taken into account individually in the estimation of e.s.d.'s in distances, angles and torsion angles; correlations between e.s.d.'s in cell parameters are only used when they are defined by crystal symmetry. An approximate (isotropic) treatment of cell e.s.d.'s is used for estimating e.s.d.'s involving l.s. planes.
Refinement. Refinement of $F^{2}$ against ALL reflections. The weighted $R$-factor $w R$ and goodness of fit $S$ are based on $F^{2}$, conventional $R$-factors $R$ are based on $F$, with $F$ set to zero for negative $F^{2}$. The threshold expression of $F^{2}>\sigma\left(F^{2}\right)$ is used only for calculating $R$-factors(gt) etc. and is not relevant to the choice of reflections for refinement. $R$-factors based on $F^{2}$ are statistically about twice as large as those based on $F$, and $R$ - factors based on ALL data will be even larger.
