

Rural Landscapes of Roman (northern) Liburnia: Diachronic Development of Organisation and the Economy in Extra-Urban Territories in the Light of Recent Archaeological Research

The archaeology of Roman rural landscapes in the province of Dalmatia, and especially northern Liburnia, has until recently focused on single-site or single-monument analyses, allowing for only geographically patchy and chronologically limited conclusions. Considering the results of recent research in the wider Kvarner and sub-Velebit area, the paper discusses issues of Roman extra-urban territorial organisation, the formation and evolution of settlement and economies on rural estates. Using several case studies, the role of indigenous residents and immigrants in the organisation of the countryside during the early Imperial era is addressed, testifying to a diversified social structure of both landowners and the employed workforce. Later developments in rural settlement are analysed through the prism of newly emergent geopolitical factors emerging in the region from the 3rd century onward. The Christianisation of rural areas and associated novel social practices, and possibly new forms of habitation, are also covered. Finally, the final phases of use of rural sites can now be more cogently discussed thanks to new data from several, mainly insular sites.

Archaeology of the rural world of Roman Dalmatia and northern Liburnia

The archaeology of Roman rural landscapes has had a Mediterranean-wide *flo-ruit* since the establishment, in the 1950s,¹ of large field survey projects aimed at identifying sites and features within different regional settings. Topics such as settlement pattern, site typologies, land-use, productive systems, and their diachronic development have been in the focus of exploration, aided by the application of increasingly complex field data acquisition, elaboration, and analysis techniques, with growing use of remote sensing and digital tools for data manipulation.² Alongside methodological advances, a set of novel theoretical approaches to data interpretation³ accompanied the growing number of survey projects throughout

the Mediterranean and continental Europe, allowing for discourse on economic, demographic and social issues from a comparative perspective, but also raising awareness of the method's inherent limitations.⁴ Roman extra-urban and rural territories were simultaneously approached through targeted research into single sites, their architecture, infrastructure and broader topics aimed at understanding not only the modes of organisation and occupation of these areas, but also their inhabitants, communication infrastructure and crafts,⁵ often through regional overviews and with attention to subsequent transformations.⁶ Another aspect that research into rural areas implies is their economic productivity and their incorporation into trade, commerce, and the overall economy of the broader region. Novel theoretical approaches to economic history were employed, namely New Institutional Economics (NIE) which, stated succinctly, implies a turn towards local institutions, social norms and the legal framework within which a society functions.⁷ This allows for a better understanding of property rights, productivity and relationships established within the various actors in the rural economy, as well as the role of government in managing such issues as productivity or investment.⁸

Scholarly interest in the rural world of Roman Dalmatia, on the other hand, has been patchy, and applied methods varied mostly on the basis of available data, geomorphology, and other features of the regions under scrutiny. Systematic surveys were fairly rare and mostly focused on the central Dalmatian islands⁹ and the Ravni kotari/northern Dalmatia region,¹⁰ accompanied by topographic and reconnaissance surveys¹¹ and excavations at a number of Roman rural sites,¹² again mostly concentrated in the aforementioned areas. In many cases these dealt with distinct segments of a site, e.g. productive sectors or subsequent early Christian or later churches, or specific research problems.¹³ Similarly, the interest of scholars of ancient history rarely revolved around topics related to rural areas, mostly

due to the scarcity of both historic and epigraphic sources, an exception being the mining district in Dalmatia's hinterland.¹⁴ The seminal work of M. Suić on Roman urbanism on the eastern Adriatic¹⁵ and a few other publications¹⁶ provide some insights into the urban-rural relationship and the organisation of rural areas, at least from a theoretical and historic standpoint, but archaeological data failed to follow in a more substantial manner.

Research on the economy of the region suffered from the same pitfalls, being mostly based on very scant mentions in Roman literary and geographical works,¹⁷ thus appearing detached and difficult to combine with the picture emerging from archaeological field work and material culture studies.

The Kvarner Gulf and sub-Velebit zones (an area consisting of islands, a narrow coastal belt and the mountainous eastern slopes of Učka and Velebit), a part of Liburnia in Roman times, specifically its northernmost part (Fig. 1),¹⁸ have until recently rarely been included in either rural site surveys and more systematic investigations of single rural sites, leaving a blank in our knowledge and best illustrated by the few published rural site distribution maps.¹⁹

The lack of identified sites as well as more detailed knowledge of their features and the overall organisation of rural territories hindered the inclusion of this highly urbanised area (with 13 municipal communities and other minor urban centres, e.g. Volcera)²⁰ in any discussion of rural economy, settlement, urban-rural relationships, and their economic and legal organisation. Thanks to data gathered by several recently conducted or still on-going surveys and excavation projects,²¹ our knowledge of the countryside in Roman northern Liburnia has been substantially enriched, allowing the authors of this paper to propose certain developmental vectors, consider its economy and overall organisation, and propose avenues for future research.

²¹ These include both systematic topographic reconnaissance and extensive surveys, as well as targeted reconnaissance of single monuments and/or areas, including: the Vinodol and Crikvenica areas, the island of Krk, the Cres-Lošinj archipelago, the islands of Rab and Pag, and the sub-Velebit zone (see below for a basic bibliography).

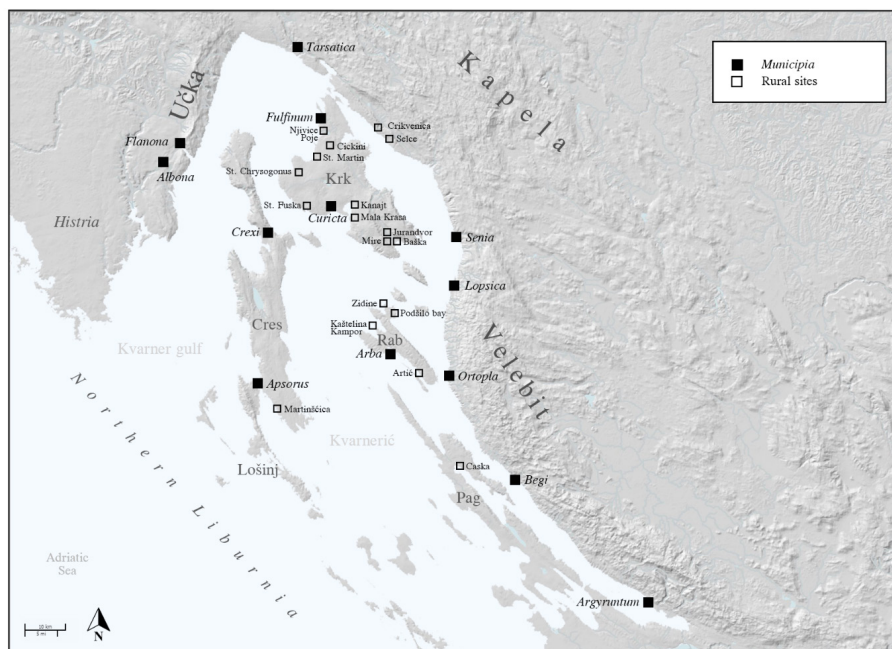

Figure 1. Map of northern Liburnia with Roman municipia and most important sites mentioned in the text (author: A. Konestra, base map: Google Maps/Snazzy Maps)

A starting point? Pre-Roman territorial organisation

The lack of territorial surveys hindered not only the recognition of Roman rural settlements, but also those dated to previous periods, so far mostly recognised as hillforts,²² with scant data on any other type of proto-historical occupation. Recently, surveys conducted in the sub-Velebit area and the application of subsequent spatial analysis²³ made it possible to more thoroughly ascertain the organisation of settlement patterns in the territories belonging to proto-historic communities, often centred around settlements that later became municipia and possessing a clear settlement hierarchy.²⁴ In the case of Roman Lopsica (Sveti Juraj) and its wider territory, Iron Age settlements and enclosures dotted the coastal hills often linked to suitable coastal berthing locations, communication with the hinterland and water sources, although each community also possessed territories in the highlands devoted to herding in the hot summer months.²⁵ Within this system, a

²⁵ GLAVAŠ & GLAVIČIĆ 2017: 123-124; 2019: 124, 129

primary settlement could be recognised as well as an organisation that suggested social hierarchies²⁶ comparable to those identified in southern Liburnia.²⁷ Transhumant husbandry survived the dawn of antiquity, as testified by epigraphic monuments, i.e., inscriptions testifying to inter-community boundaries found at several locales on Velebit.²⁸ One example tells of an agreement on access to water between the coastal Ortoplini and the hinterland community of the Parentini, and another was found close to an actual boundary wall demarcating the territories of the Ortoplini and the Begi.²⁹

Some data on the actual settlements can be inferred for subsequent island municipia of Curicta (Krak),³⁰ and Apsorus (Osor, Cres),³¹ while a smaller, possibly “satellite” settlement has recently been reliably identified on the Kaštelina/Stolac peninsula at Lopar on the island of Rab.³² How it was linked to the hillforts and tumuli identified on the ridge south of the site,³³ and what its exact typology is cannot be inferred as yet, although short-lived, productive activities and a possible connection to maritime communication may be suggested. Its sudden demise, inferred on the basis of geophysical prospecting and still on-going trial trenching, indicates no connection to later, Roman settlement activities. Whether the hillfort system in the north-western part of the island of Rab was detached from Arba, the only settlement that became a municipium, or the latter was hierarchically the island’s main settlement – as proposed for the municipia of the nearby Velebit coast – is still difficult to ascertain. Nevertheless, minor settlements or productive units connected to agriculture or husbandry have not been securely identified for the proto-historic period, as is the case in the neighbouring region of Ravni kotari.³⁴

Roman organisation of extra-urban territories: formation of estates, settlements, infrastructure and the economy of northern Liburnia

Most scholars agree that the central settlements in pre-Roman north-east Adriatic communities usually became Roman urban centres of municipal rank after

the assignment of certain benefits, such as *ius Latii* or immunity.³⁵ Debate on the reasons, modes and significance of these benefits and the subsequent elevation of northern Liburnian communities to municipal rank is still ongoing,³⁶ hindering a full understanding of the organisation of estates and the influx of Italic settlers. As mentioned before, the pre-Roman territorial organization in some of these centres undoubtedly continued into the early Imperial period, and the role of the local elite within urban government³⁷ further backs the idea of at least partial continuity of social structures and organisation.

Recent territorial surveys on the island of Rab made it possible to recognise the vibrant rural settlement of the island's fields (Kamporsko, Mundanijsko, Supetarsko, and Loparsko *polje*) and coastal belt, seemingly dotted with residential-productive sites tentatively identifiable as "villae",³⁸ farms and attached or isolated productive facilities,³⁹ such as, e.g., pottery kilns. Research into other areas in the Kvarner region indicates the same dense habitation pattern in rural areas and exploitation of available resources, e.g., the island of Pag,⁴⁰ the Vinodol valley⁴¹ or Baška and its hinterland.⁴² Unfortunately, the scarcity of rural stratigraphic contexts pertaining to the 1st century CE hampers our understanding of the times and modes for the establishment of the various complexes recognised within the countryside of northern Liburnia, though several case studies indicate that interdisciplinary approaches might also shed some light on this aspect, engendering a better understanding of specific areas at the very least.

The best chronological evidence has so far been gathered at Crikvenica, where an early Roman pottery workshop was excavated yielding a large segment of the production facilities and more than 50 tons of ceramic material, including several amphorae types, ceramic building materials and pottery. Tile stamps mentioning both the type of estate – a *saltus* – and its owner – Sextus M(e/u) tillius Maximus – are the only direct evidence in the region of a private estate, its typology and ownership. Attire and numismatic finds, imported pottery and ¹⁴C

dates place the establishment of the *figlina* in the Augustan-Tiberian era.⁴³ Early large-scale landed acquisition by a north-Italian entrepreneur,⁴⁴ accompanied by the establishment of agricultural and pottery production, can thus be inferred, while a survey of the wider Vinodol valley indicates that the *saltus* of Sextus may have been located there.⁴⁵ Other sites also yielded evidence of foreign, Italic, ownership of rural estates in the region. A significant find is a sepulchral monument from the island of Ilovik⁴⁶ that mentions a certain Cornelius, magistrate in Aquileia, whose link to the large settlement on the nearby island of Sveti Petar has been proposed.⁴⁷ The importance of the Ilovik-Sveti Petar archipelago to navigation and trade in the region is notorious,⁴⁸ thus the presence there of an important figure from early imperial Aquileia (either as an owner or in some other capacity) further supports such claims. A recently discovered inscription at Martinšćica on the island of Cres pertaining to a dedication to Diana by a certain P(ublius) Cluentiu[s] / L(uci) f(ilius) A[...],⁴⁹ further links persons from northern Italy to landed estates in Kvarner, as here too a rural settlement existed in early Roman times.⁵⁰ The most emblematic case is, however, that of the large estate identified at Caska on the island of Pag,⁵¹ where votive monuments link the estate to the Calpurnii Pisones,⁵² while finds of food processing and possibly pottery production indicate that here too a residential and productive complex existed since at least the 1st century CE, if not earlier.⁵³ The early Roman presence in extra-urban areas has been detected in Jadranovo-Lokvišća as well, but not in relation to the later architectonic complex identified in the bay as well. Here, evidence of black gloss pottery, Esquillino and radial type lamps, and numismatic finds datable to the 2nd-1st century BCE indicate very early settlement of the area, though the modes and functions have yet to be determined.⁵⁴ The

necropolis on Cape Rtac,⁵⁵ which encloses Lokvišća Bay from south is evidence of early Imperial occupation.

A case study encompassing the island of Rab and dealing with funerary evidence (both archaeological and epigraphic) has shown that rural necropolises can be used as indicators for the location and chronology of both sites, and moreover shed light on several social features.⁵⁶ In fact, in numerous instances, 1st century CE sepulchral monuments are the sole evidence of settlement on the island's fields and coastal belt, and when combined with data from systematic reconnaissance or excavation, they form complementary datasets useful to determine ownership, chronology, and possibly suggest economic status. It has thus been shown that at least since the late 1st century CE the rural landscape on the islands was divided between estates in all probability belonging to both local elites (i.e. the *Baebii*) and Italic immigrants (e.g. the *Remii*) (Fig. 3b).⁵⁷ Regionally, the persons mentioned on inscriptions recovered at rural sites can be connected to the functioning of an estate in only a few cases⁵⁸: a supposed procurator from Crikvenica,⁵⁹ a person of supposedly servile status from Banjol on the island of Rab,⁶⁰ and several others from Caska,⁶¹ clearly members of the estate's staff as their functions of *villicus* and *dispensator* would suggest.

Although only very few Roman rural complexes in the region are being systematically excavated, some data on their setting, layout and productive infrastructure is available, allowing for a cursory overview. Firstly, the location of rural residential and productive settlements can be assessed, as the aforementioned surveys indicate that both (peri-)coastal and inland areas were densely settled. On both the coast and the islands, maritime and coastal complexes ("villae") developed early on, often on promontories or directly on the seashore, valuing thus not only communication possibilities and harvesting of the sea, but in all likelihood the scenic features of these locations as well.⁶² A few such sites have been investigated to various degrees on the island of Rab. There, at Kaštelina in Kapor and Zidine in Lopar

a terraced solution for the layout of the complexes can be envisaged thanks to the presence of possible cryptoporticos and/or *basis villae* substructure solutions⁶³ (Fig. 2/1). Similarly, part of the complex in Caska on the island of Pag was also arranged on a slope descending toward the sea, as well-preserved terracing walls seem to suggest.⁶⁴ Elsewhere, such as at Artić in Barbat (island of Rab), Njivice (island of Krk),⁶⁵ and Sveti Petar near Ilovik,⁶⁶ the architecture was arranged on lower grounds near the shore, today thus being partly submerged due to sea level change.⁶⁷ Njivice and Artić provide data on some aspects of the residential sector of the sites, including hypocaust floors possibly connected to small *thermae* or heated rooms (Fig. 2/2, Fig. 3, Fig. 4).

On the other hand, on the island of Rab a network of Roman sites was located away from the coast, usually on the peripheries of fertile fields or on elevated positions on them. In Kampor field they are located under the northern hillslopes and probably in the vicinity of the Franciscan St. Bernardine of Siena Monastery,⁶⁸ while

⁶⁸ KONESTRA & CAMBI 2020-2021: 366-372.

clusters of evidence are present in the area of Banjol and Supetarska Draga, often in relation to water sources (Fig. 5a).⁶⁹ Similar instances of rural sites have been ascertained on Lopar filed as well. As none have been systematically excavated and only some have undergone geophysical surveys, their layout and dimensions remain largely unknown, though movable finds do point to the long continuity of use of most, and to the presence of productive or storage features (such as vats, dolia, etc).⁷⁰ It is thus difficult to say whether they should be defined as farms, or should be linked to larger estates with complex internal organisation.

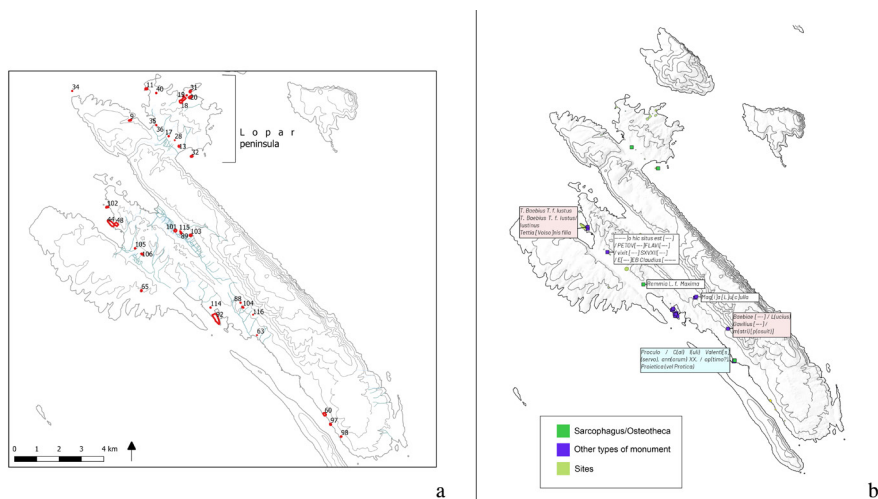

Figure 5. a – Ascertained Roman sites on the island of Rab; b – Location of sepulchral finds and transliteration of sepulchral monuments from rural areas on the island of Rab (author: A. Konestra; source: Archaeological topography of Rab Island project GIS)

Similar instances have been recorded on the adjacent islands of Krk and Pag as well. The case of Baška and its valley (Bašćanska draga) on Krk is particularly telling. There, at Jurandvor, one such complex was partially excavated, located beneath the later Church and Monastery of St. Lucy, and provisionally dated to late antiquity, although evidence of early Roman settlement is also present in the vicinity⁷¹ (Fig. 6/1).

⁶⁹ KONESTRA et al. 2021: Fig. 2.

⁷⁰ KONESTRA et al. 2017: 104-105; 2021: Fig. 2; WELC & KONESTRA forthcoming.

⁷¹ R. STARAC 2019: 60-62.

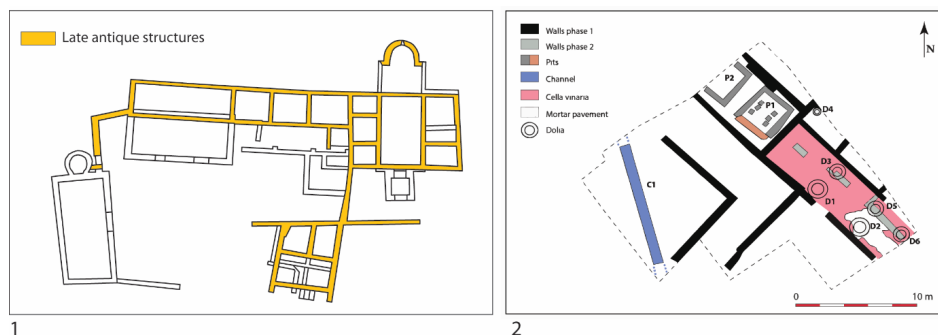

Figure 6: 1. Jurandvor-St. Lucy (elaborated after: R. STARAC 2019); 2. Pressing installations and dolia defossa at Caska (drawing: V. Pellegrino, from GRISONIC & STEPAN 2022: Fig. 3)

The structures encompass an area of roughly 30x40 m, with a sector consisting of rooms of varying dimensions around an enclosed courtyard, and other sectors extending eastward (under today's church) and southward. But settlement in the area was far more complex, as Roman settlement nuclei can be followed from the coastal area of Baška, where sporadic finds and an excavated necropolis testify to a possibly larger settlement,⁷² and throughout the valley,⁷³ often in association with late antique (or later) churches, such as in the cases of Mire⁷⁴ and Sveti Juraj.⁷⁵ Such a situation is difficult to interpret, for it may indicate sparse settlement, as in the case of several smaller landholdings or tenant farms, but also a large estate with several residential-productive units, or even be indicative of a more nuclear settlement typology, such as a *vicus* (see below). Similarly, in the areas of Caska and Kolan on the island of Pag, a series of zones with a concentration of Roman finds⁷⁶ might signal such a complex settlement organisation. By way of analogy, numerous sites in the hinterland of Crikvenica and at nearby Selce might be indicative of the extent of the estate (*saltus*) of Sextus M(e)u)tillius Maximus, although at this point it is difficult to ascertain their relationship.⁷⁷ In fact, as elsewhere on the eastern Adriatic,⁷⁸ excavations in the region usually tackled the most prominent architectural remains at a site (what might be called

the “villa” building or a subsequent church), while adjacent zones remain unexplored, hindering a full understanding of the actual extent of the settled area. An exception is the settlement in Podšilo Bay in Lopar on the island of Rab, where several buildings have been identified thanks to geophysical prospecting in this shallow bay’s hinterland (Fig. 7).

Figure 7. Organisation of the settlement at Podšilo Bay, Lopar, island of Rab (Authors: A. Konestra; F. Welc; base map: DOF DGU)

A large complex on its northern slope and smaller and/or poorly preserved buildings on the southern and western slopes⁷⁹ indicate a complex settlement organisation, along which a detached pottery production facility⁸⁰ was identified on the bay’s northern shores. While the chronology of the individual architectonic units has yet to be more precisely defined, the large northern complex (Complex 1), with rooms and corridors developing around what would seem to be a central courtyard and the smaller square building excavated on the southern slope (Complex 2) do point to contemporary, late antique phases of use, perhaps as the main residential and productive building and an ancillary storage/economic unit.⁸¹ Nevertheless,

⁷⁹ WELC et al. 2017; 2019; WELC 2018.

⁸⁰ LIPOVAC VRKLJAN & ŠILJEG 2012.

⁸¹ WELC et al. 2019; KONESTRA et al. 2020: 233-237.

early habitation of the site has been ascertained by material culture finds.⁸² Similarly, structures detected remotely in the hinterland of the complex on Cape Zidine (Lopar), may suggest that this settlement also had a more complex organisation.⁸³

Regardless of the paucity of data provided by the few more extensively excavated sites, information on the earliest organisation of productive activities at rural sites in the region can be derived from an analysis of products and infrastructure connected to certain aspects of their economy. The emblematic case of Crikvenica's pottery workshop thus helps to understand many of these aspects, firstly thanks to the aforementioned tile stamps (see above), but also to the array of amphorae produced at the site, and recognised as containers for wine, olive oil and fish products.⁸⁴ Products of the *figlina* include loom weights as well,⁸⁵ possibly indicating if not a regional, then at least textile production on the estate and perhaps the associated sheep husbandry. Moreover, road infrastructure and the possible adjacency of a favourable marine berth,⁸⁶ as well as the regionally wide distribution of products, speak in favour of market-oriented production on the wider estate. Docking facilities were identified at Artić near Barbat (Rab)⁸⁷ and Caska (Pag), the latter possibly also devoted to commercialisation of estate products.⁸⁸

Elsewhere, with the exception of Caska, where a pressing installation was unearthed (Fig. 6/2),⁸⁹ food processing can for now be only presumed on the basis of meagre data. Stone fragments belonging to parts of possible Roman presses or *molae* were identified at St. Martin, St. Fusca and Krk on the island of Krk, while remains such as *spicatum* floors or small vats (identified near Tarsatica, at Selce, Podšilo Bay on Rab, and perhaps under the Church of St. George at Mala Krasa, Fig. 9, 11) might be connected to productive spaces. A structure discovered at Njivice-Poje is enigmatic: it is a circular enclosure interpreted as a portico/courtyard, but its size, location and structure suggest its use as a threshing floor⁹⁰ (Fig. 2/2). Other reliable data for food production is scant, though fish farming troughs, and especially salt pans identified in the region, may have been established as early as Roman times.⁹¹ Similarly, a recently identified trapezoidal structure on

⁸² The materials stem from 2022 excavation campaign and are still being analysed.

the Fruga plateau on Rab might be connected to sheep husbandry and possibly dated to the Roman era thanks mainly to tegulae finds.⁹²

The changing face of northern Liburnia from the mid-Roman period into late antiquity

A somewhat “dark” period of rural settlement in the region spanned from the late 2nd to the 4th century, when available data fail to provide sufficient information on the evolution of identified settlements, mainly due to inadequate publication of stratigraphic assemblages.⁹³ In fact, regionally limited stratigraphic data impedes a more detailed understanding of structural changes, abandonment phases and possible reuse at most rural sites, i.e., diachronic sequencing built on a robust chronological, material culture-based framework is still lacking.

Changes in the economy of adjacent regions, chiefly northern Adriatic Italy,⁹⁴ where wine and olive oil production seem to have severely diminished from the mid-2nd century onward, changes noted in various other aspects, including settlement patterns,⁹⁵ would suggest that we could expect a similar scenario in northern Liburnia as well.

From the mid-2nd century onward, the role of northern Liburnia within the north-eastern defence system of Italy became more relevant. Tarastica and its territory, firstly inserted in the *Praetentura Italiae et Alpium*, were then part of a short-lived procuratorial province established in the late 2nd century,⁹⁶ while as of the mid-3rd/4th century,⁹⁷ the town played a vital role in the *Claustra Alpium Iuliarium* (CAI). It was not only the seat of a garrison but also the main port supplying the network of forts and fortifications being erected in its hinterland.⁹⁸ This

⁹² For analogical structures interpreted in relation to husbandry, see BADAN et al. 1995.

⁹³ For a similar situation elsewhere in Dalmatia, see GRAČANIN 2015b, especially p. 85-86.

⁹⁴ While considering the numerous differences (be it political, organisational, etc), the area can be seen as analogous due to similar economic developments and strong reciprocal connections. Also, research into rural sites there has a long tradition and ample analogous examples to draw from (e.g. various contributions in *Antichità Altoadriatiche* XXVI, 1985; BUSANA 2002; MATIJAŠIĆ 1998; BULIĆ & MATIJAŠIĆ 2014; ZGRABLIĆ & BULIĆ 2017; ZAMBONI 2022).

⁹⁵ For an overview see MARZANO 2021: 506, 512, 515; see also BROGIOLO 1996; CASTRO-RAO BARBA 2014; GREY 2016. For the eastern Adriatic in general BEGOVIĆ & SCHRUNK 2001.

⁹⁷ For debates on the dating of the system, which most authors agree was constructed over a longer period of time see TURKOVIĆ & BASIĆ 2013: 44, n. 40; KOS 2014; VIŠNJIĆ 2019: 58-65.

⁹⁸ TURKOVIĆ & BASIĆ 2013: 44; KUSETIĆ 2014a: 34-35; VIŠNJIĆ 2019a; 2019b; VITELLI CASELLA 2021: 146, all with earlier bibliography.

newly developed border zone character of the wider area⁹⁹ must have influenced not only incoming, but also outgoing trade, possibly bringing a new impetus to the regional economy. The outcome of this novel geopolitical situation is visible through architectural evidence within urban and peri-urban areas, and might be related to changing economic factors in the vicinity of the *CAI*. Munificence, defensive wall construction and similar public endeavours can be seen at several towns in the region over a longer period beginning in roughly the 3rd century (e.g., Arba, Tarsatica, Senia),¹⁰⁰ while the degree to which these changes were reflected in rural areas remains poorly understood, though a certain degree of interconnect- edness might be suggested on the basis of recent survey data.¹⁰¹

In rural areas some changes can be detected as early as the mid-2nd century, when pottery production at Crikvenica apparently ceased,¹⁰² though whether this indicates major changes within the wider estate is still poorly understood, but a cessation of intensive food production and/or its massive commercialisation are evident. Several possibilities might explain such an occurrence, most notably a drastic change in produced goods or a change in the nature of the estate.¹⁰³ The site of the *figlina* was then repurposed as a small (?) necropolis dated to the late 3rd-4th century,¹⁰⁴ and sporadic frequenting of the area is attested by numismatic finds,¹⁰⁵ though no permanent structures could be ascertained. Contrary to that, on the basis of still scarce ceramic and numismatic evidence, it would appear that the site in Podšilo Bay (Rab) was first established no later than the onset of the 2nd century, while production of ceramic building materials apparently commenced later (late 3rd-4th c.),¹⁰⁶ when major architectural works seem to have occurred at several areas at the site, especially at what was identified as the main residential building.¹⁰⁷ It remains possible that part of the produced ceramics were commercialised. Other rural complexes, as proven in other parts of Dalmatia,¹⁰⁸ seem

¹⁰⁸ ZEMAN 2014: 40. According to certain scholars, in Dalmatia the period of the 4th-5th centuries, i.e., from the reign of Diocletian onward, is one of large villas - praetoria, and not rustic villas (e.g., TURKOVIĆ & MARAKOVIĆ 2012: 63), though in northern Liburnia no such site has so far been identified. For praetoria see lastly in CASTRORAO BARBA 2020: 108-109 with bibliography therein.

to have been erected or more substantially renovated in the same time frame: Jadranovo-Lokvišća on the coast,¹⁰⁹ Jurandvor,¹¹⁰ Sveti Krševan¹¹¹ and Cickini¹¹² on the island of Krk, and Caska¹¹³ on the island of Pag.

Perhaps the most drastic and monumental change that impacted rural areas from the late 4th/5th century onward is the formation of a network of early Christian churches.¹¹⁴ Often placed within earlier or in some cases perhaps contemporary residential-productive complexes, on their outskirts or near communication routes,¹¹⁵ their location points to a renewed investment in the countryside, but also to the level of rural settlement, clearly still populous and vibrant.¹¹⁶ Some of them, furnished with a baptistery or those with a funerary function, were clearly erected as focal points of a larger settlement or wider area, on some occasions financed by their own inhabitants.¹¹⁷ Unique evidence is provided by the inscriptions on the mosaic pavement of the basilica at Mire near Baška (late 4th-5th c.), where the names of the members of several families (12 cornices are preserved)¹¹⁸ point to a communal investment in the erection and furnishing of the church.¹¹⁹ The latter

evidence might also indicate that rural settlement is here organised in a radically different way than before, that is, we may read it as evidence of a *vicus* or as the emergence of a village type of habitation,¹²⁰ with single family habitation units. At this point, though, the way in which such settlement may be related to forms of land ownership in the region is still unclear, though certain architectural traits might shed some light on the matter. In fact, on other occasions, the church building seems to be in direct contact with a clearly residential building¹²¹ of late antiquity, as in Cickini (island of Krk)¹²² and probably Martinšćica (island of Cres). In the first case, a square, probably multi-story building was explored in close proximity to a church with baptistery¹²³ (Fig. 8), the latter erected on the faint remains of an earlier architecture, present in the site's environs as well.

Figure 8. Aerial image of Cickini site (photo: S. Ilić, courtesy of PPMHP Rijeka)

The ground floor comprises a large hallway flanked by smaller rooms, leading to a centrally positioned room furnished with an apse. The presence of a possibly later added apse was ascertained within the still unexplored residential complex at Martinšćica as well.¹²⁴ Such solutions stem from the urban architecture of the

4th century, serving the function of receiving guests (banqueting and audiences) and to fulfil the strategy of self-representation by the late Roman elites.¹²⁵ This feature might then be indicative of a renewed interest by the elites (*possessores*) in residing in rural areas and signal the existence of large landed possessions characterised by a central more or less luxurious building and a series of detached habitation nuclei, often at a certain distance, as identified in other regions during the 4th and 5th centuries.¹²⁶ Regionally, still lacking a clear and precise chronology, such aspects should be better investigated in the future, just as more light should be shed on the relationship of these residential complexes with adjacent churches.¹²⁷ On the other hand, in several cases the churches were erected directly on earlier structures, as in the case of two churches in the environs of Punat, on Krk, i.e., St. Peter at Kanajt and St. George-Mala Krasa (Fig. 9).¹²⁸

Figure 9. Layout of the various building phases detected at the sites of St. George-Mala Krasa and St. Peter-Kanajt near Punat (Krk Island) (elaboration on the bases of R. STARAC 2004: fig. 1, 3)

Evidence of sepulchral practices in the environs of rural settlements, or within them, and in connection to with Early Christian churches, is another indicator

¹²⁶ E. g. SFAMENI 2012: 54-55; BRIGIOLO & CHAVVARIA ARNAU 2018: 185. The famous epistle of St. Jerome mentioning his “*villula*” (*Ep. LXVI* dated to 397 CE), if his estate was actually located in Liburnia, might be the only historic reference to late antique rural residences, their management and *possessores* in the region (SUIĆ 1986: 236-237; see lastly in DOMIĆ KUNIĆ 2021 with extensive previous bibliography).

¹²⁷ E.g. BOWES & GUTTERIDGE 2005: 413; SFAMENI 2012: 60-61; ZEMAN 2014: 40; CASTRORAO BARBA 2014: 277-281, n. 31 with earlier bibliography.

¹²⁸ R. STARAC 2004.

of the continued occupation of rural areas.¹²⁹ However, interment inside earlier productive or inhabited areas was ascertained only in two cases: at Crikvenica (see above) and Caska,¹³⁰ both related to infant/child burials. Reuse of residential-productive areas for burial seems to be regionally rare, and is usually marked by single burials.¹³¹ The graves made of “bricks” at Njivice-Poje could be added, though data is too meagre to ascertain a precise location, typology and chronology.¹³² On the other hand, at certain sites, such as Baška-St. Mark¹³³ and Jadranovo-Lokvišća,¹³⁴ the continuation of earlier necropolises has been ascertained at least within the 4th century. One tomb with multiple, mostly child interments dated to the 4th-early 5th century was recently excavated at Pudarica on the island of Rab; it was clearly part of a wider burial ground, and might suggest the existence of dedicated burial areas, perhaps with sectors for children, located on the outskirts of rural settlements.¹³⁵ The shift to interments inside (usually the vestibule) or in immediate vicinity of Early Christian churches¹³⁶ seems to have been regionally typical. Expensive interment solutions (such as sarcophaguses), speak in favour of elite burials in connection to some of the identified churches (e.g., Mire near Baška on Krk, Church of St. Stephen in Barbat and perhaps Lopar on Rab, island of Sveti Petar near Ilovik),¹³⁷ though several burial typologies have been identified (stone-built, vaulted, simple pits, etc),¹³⁸ rendering identification of social differentiation more complex. Data derived from sarcophaguses typology and other finds might indicate a rather late, later 5th-6th century, occurrence of such a practice which seemingly lasted into the 7th century,¹³⁹ though data does not suffice to define this as a trend.

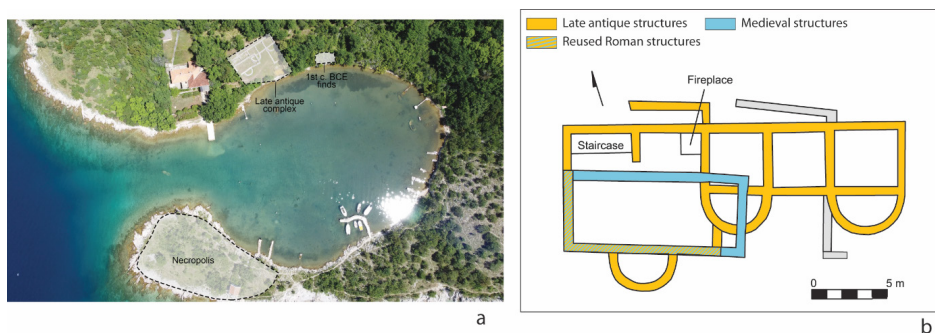

Figure 10. a. Aerial image of Jadranovo-Lokvišća site with main archaeological zones marked (photo: A. Konestra); b. Layout of the late antique complex at Jadranovo-Lokvišća (elaborated after: R. STARAC 2002 and later plan courtesy of MGC)

The already mentioned militarisation of the region seems to have continued under Ostrogoth and Byzantine rule in the form of a more pronounced fortress construction¹⁴⁰ which strongly altered the region's landscape, while the only instance of a "fortified" rural complex might be that of Jadranovo-Lokvišća (Fig. 10).¹⁴¹ As opposed to the situation in neighbouring Istria, where a good number of historic sources informs us on both the economy of the region during Ostrogoth rule and the subsequent changes after the establishment of the Exarchate at Ravenna,¹⁴² sources for Kvarner are scant. Apart from data testifying to it being administratively isolated from the wider Liburnian territory as the short-lived entity of *Liburnia Tarsaticensis*,¹⁴³ and to the existence of a *commes insulae Curictanae and Celsinae* (as reported by Cassiodorus in *Variae*),¹⁴⁴ historiography provides very little data for the Ostrogoth period¹⁴⁵ or later.¹⁴⁶ Of particular interest here is a possible reference to Kvarner contained in the letter by Cassiodorus, *Provincialibus Histriae Senator PPO* (12.22), dated to 537/538, which praises the islands and their maritime utility, as well as their fertility.¹⁴⁷ Nevertheless, more

or less contemporary data on rural settlement has recently been ascertained in the cases of Podšilo Bay, Jurandvor and Jadranovo-Lokvišća, possibly testifying to abandonment and re-use/re-settlement of dilapidated rural buildings. In the first case, a series of postholes has been ascertained both in the southern and northern complex; in the latter a small hearth laid above a no longer used mortar floor points to an at least partial habitation character of these reoccupations, while in the former a waste pit containing apparent kitchen discards might indicate the presence of an area for food preparation somewhere in the vicinity (Fig. 11).

Figure 11. a - Trench 2 at Complex 1 in Podšilo Bay – earlier walls, postholes and hearth; b – Trench 1 at Complex 2 in Podšilo Bay – earlier walls, postholes and pit (Orthophotos: K. Rabiega)

The fact that such evidence was ascertained at both locations in Podšilo Bay speaks in favour of a multi-family (or multi-group) re-occupation of the site,¹⁴⁸ though its duration and character are still unclear. The analysis of finds point to a 6th-7th century chronology of these features.¹⁴⁹ Finds of iron slag indicate recycling and spoliation activities going on at the site,¹⁵⁰ while the evidence for marine har-

¹⁴⁸ E.g. BOWES & GUTTERIDGE 2005: 410.

¹⁴⁹ NOWACKI et al. 2022.

¹⁵⁰ KONESTRA et al., 2022.

vesting activities (e.g., shells, lead fish-net weights) is extensive. At Jurandvor, along with traces of repair of the floors, a hearth found above an earlier floor and below the foundation of the later Benedictine monastery equally points to subsequent habitation of the perhaps already ruined villa.¹⁵¹ A hearth built with the fragments of a sarcophagus was found inside the complex at Jadranovo-Lokvišća, but as its dating is uncertain, it might date to later periods.¹⁵² Whether such data could be linked to a population shift toward other sites or forms of habitation, a different use of a certain sector of an estate or indicate an overall social and economic shift¹⁵³ has yet to be better understood. The aforementioned Ostrogoth sources, however, generally very occupied by the middle class *possessores*, chiefly as tax payers, would suggest that estate production as well as commerce were still well developed.¹⁵⁴ Another common late antique phenomenon has been noted in the region, that is, the introduction of extra-urban and rural features in towns – mainly necropolises and productive features.¹⁵⁵ Such was the case of municipium Fulfinum on the island of Krk, where a late antique necropolis is located just a few dozen of meters from the forum, and a pressing installation (olive processing?) has been ascertained adjacent to a suburban residential complex with a substantial 5th-6th century phase of use.¹⁵⁶

Concluding remarks and future avenues of research

Though patchy, our knowledge of several aspects of extra-urban territorial organisation, resource exploitation and settlement in northern Liburnia has grown substantially in recent years. So much so that diachronic development can now be proposed, certainly open to further fine tuning of and great insight into certain aspects. Moreover, the rural landscape can now be populated with actual actors involved in the development of landed estates and the establishment of the earliest residential and productive complexes in the region. Most importantly, local pre-Roman elite families, now living alongside immigrants of diverse socio-political backgrounds, seem to have maintained their social roles and possibly their estates, whose actual nature we may now begin to understand. The paucity of historic sources does impede an understanding of legal matters, the conveyance of property and the social status of those involved in production,

¹⁵¹ R. STARAC 2019: 61. The authors would like to thank Ranko Starac (PPMHP, Rijeka) for further information on this aspect.

¹⁵² R. STARAC 2002: 197.

¹⁵³ E.g. WICKHAM 2005: 473-481; DŽINO 2017: 157; BOWES 2018: 461.

¹⁵⁴ Generally in GRAČANIN 2015a: 51-57, 66; also MATIJAŠIĆ 2012: 171

¹⁵⁵ For adjacent areas see e.g. MATIJAŠIĆ 2007; KOPAČKOVA 2020.

¹⁵⁶ ČAUŠEVIĆ-BULLY 2014; ČAUŠEVIĆ-BULLY & BULLY 2015.

though some hint of these aspects can now also be proposed. Perhaps the most important conclusion that can currently be drawn is that early urban development of the region's municipia was accompanied by an equally early organisation of rural areas, the two functioning side-by-side and not in a strictly hierarchical relationship,¹⁵⁷ and in which both locals and immigrants played an important role (Crikvenica, Caska, island of Rab).

For later periods, which see the transformation of earlier rural complexes along different trajectories dictated by major political, social and cultural changes¹⁵⁸ (e.g. the growing importance of the region in Italy's defence system, changes in the Adriatic economic and trade systems, Christianity, etc), we can begin to recognise patterns detectable in adjacent areas as well.¹⁵⁹ The demise of large-scale production or its radical change seems to occur contemporarily as elsewhere along the Adriatic,¹⁶⁰ perhaps indicative of more widespread socio-political or economic phenomena. The dispersed pattern of rural residences ("villas"), that is, estate centres¹⁶¹ and farms, seems to change with the onset of the 5th century; "centrality" is now provided by a church building often associated with new or refurbished rural residences, early forms of villages and fortified settlements.¹⁶² Communal use can be recognised through the combination of functions that such churches often had along with *cura animarum*, that is, baptism and/or burial.¹⁶³ Evidence from Mire near Baška indicates very well how newly-developed local communities perceived and engaged with such sacral buildings.

The trajectories, modes and outcomes of the detected changes in settlement and productivity seem to be recognisable in a wider, Adriatic area, where they have been attributed to a series of factors, e.g., changes in the structure of land ownership, changing climate conditions, changes in trade networks or transport containers and many more.¹⁶⁴ What seems to differ, compared to the general Western European situation dated to the mid-5th century,¹⁶⁵ is perhaps the longer continuity of use of the "villa" as the residence of a *possessores*, while evidence of different modes of settlement, as those discerned at Podšilo and more tentatively Jurandvor, see their onset not earlier than the 6th century. In any case, while

these processes are beginning to be better understood in their materiality, a firm chronology is still far from being defined.

The nature of economic activities in the first centuries BCE can, at least in certain cases, be partly assessed (agriculture, animal husbandry and possibly fishing and other harvesting of marine life), while productive activities in the later phases of rural settlement still remain largely unknown. What seems certain is a lack of large productive facilities as those present earlier (e.g. the *figlina* at Crikvenica), thus a change in scale of production should be envisaged. Re-use and recycling as the last activities at former villa sites may be proposed mainly based on the evidence from Podšilo Bay.¹⁶⁶ On the other hand, scanty historic sources may testify to agriculture as a still vital branch of the rural economy well into late antiquity.¹⁶⁷

While leaving many open questions, the case studies examined herein have shown that a micro-regional approach to the history of extra-urban areas can shed light on specific occurrences and trajectories, which often do find parallels elsewhere, but whose explanations cannot be readily transferred without the pitfalls of over simplification.¹⁶⁸ Thus, further publications of stratigraphic contexts along with growing attention to material culture studies will certainly illustrate with much greater nuance the evidence herein of the evolution of rural settlement processes in northern Liburnia.

Acknowledgments

The data presented herein were collected through the projects *RED: Roman Economy in Dalmatia* (HRZZ, IP-2013- 3973) and *Archaeological topography of the island of Rab* (partly financed by the Ministry of Culture and Media, Lopar Culture Centre, Institute of Archaeology, Zagreb, Institute of Archaeology of UKSW). This paper was prepared as part of the project *Fall, Crisis or Transformation? Correlation of the late Antique settlement pattern changes with environment and climate fluctuations in the northeastern Adriatic region based on results of geoarchaeological and palaeoclimatic research* of the Polish Narodowe Centrum Nauki, ID: NCN 2020/37/B/HS3/02458. The authors would like to thank Goran Skelac (Geoarheo d.o.o., Zagreb) for providing original graphic material from the Njivice-Poje excavations, Ranko Starac (PPMHP Rijeka) for allowing publication of Cickini photograph, and the layouts of the Churches of St. Peter and St. George as well as many helpful information about these sites, Maja Grisonic for allowing publication of the schematic of the Caska pressing installation, and Tea Rosić (MGC) for the most recent layout of Jadranovo-Lokvišća.

Ruralni krajolici rimske (sjeverne) Liburnije: dijakronijski razvoj organizacije i gospodarstva u izvangradskim područjima u svjetlu novijih arheoloških istraživanja

Pristupajući sjeverozapadnom dijelu provincije Dalmacije, odnosno sjevernoj Liburniji, kroz suvremene metode interpretacije (rimskih) krajolika, u radu se raspravlja o formiranju, organizaciji i evoluciji izvangradskih naselja i njihovoj ekonomiji. U tu su svrhu prikupljeni podaci recentnih istraživanja provedenih na obalnome i otočnome dijelu Kvarnera, Hrvatskoga i podvelebitskog primorja. Kako bi se razumjele promjene, odnosno kontinuitet naseljavanja izvangradskih područja, rasprava započinje pregledom dostupnih podataka za predrimsku organizaciju ruralnih krajolika. Potom se, na temelju još uvijek sporadičnih i ograničenih podataka, raspravlja o formiranju rimskoga tzv. krajolika vila, o pojedincima, odnosno društvenim grupama te o gospodarskim aktivnostima koje je moguće povezati uz te, mahom novonastale, lokalitete.

Detektirajući društveno-političke promjene koje su zahvatile širu jadransku regiju i specifično sjevernu Liburniju u 3., a moguće već i u 2. stoljeću, u radu se raspravlja o mogućim primjerima prvoga „vala“ transformacija ruralnih krajolika, posebno u smislu snažnih promjena gospodarskih aktivnosti, ali moguće i strukturnih značajki ruralnih sklopova.

Daljnji razvoj i evoluciju ruralnih i izvangradskih prostora sjeverne Liburnije nešto je lakše pratiti zahvaljujući dosadašnjem velikom interesu istraživača za crkvena zdanja koja su postupno počela dominirati krajolikom od 5. st. nadalje. Sagledavajući njihov položaj u odnosu na ranije lokalitete te njihove karakteristike i pojedine nalaze, predlaže se interpretacija o značenju kapilarne kristijanizacije izvangradskih prostora u kontekstu društvenih odnosa i praksi kasnoantičkoga razdoblja. S druge strane, još uvijek rijetki podaci o transformacijama ruralnih rezidencijalno-proizvodnih sklopova omogućavaju detektiranje pojedinih procesa, poput reupotrebe i recikliranja, te njihovu interpretaciju kroz prizmu gospodarstva i mogućeg nastajanja novih oblika naseljavanja.

Iako su u radu analizirani podaci još uvijek nedostatni, posebno iz aspekta materijalne kulture, a uzorak lokaliteta daleko je od zadovoljavajućega, dijakronijsko sagledavanje razvoja i transformacija ruralnoga krajolika sjeverne Liburnije omogućeno je analizom koja uzima u obzir različite pokazatelje i izvore te analogije iz okolnih područja. Buduća stratigrafska istraživanja ruralnih lokaliteta i paralelna analiza materijalne kulture, posebno njihova dosljedna objava, zasigurno će pomoći u razrješenju brojnih, ovdje tek naznačenih i još uvijek otvorenih pitanja te omogućiti stvaranje robusnijeg modela razvoja rimskih ruralnih krajolika sjeverne Liburnije.

Ključne riječi: rimski ruralni krajolici, provincija Dalmacija, sjeverna Liburnija, rimska vila, kasna antika

Keywords: Roman rural landscape, province of Dalmatia, northern Liburnia, Roman villa, late antiquity
