 Correspondence e-mail: anndoleg@pg.gda.pl

Received 14 November 2012; accepted 16 November 2012

 Key indicators: single-crystal X-ray study;  $T = 120$  K; mean  $\sigma(\text{C}-\text{C}) = 0.005$  Å; disorder in main residue;  $R$  factor = 0.039;  $wR$  factor = 0.103; data-to-parameter ratio = 17.1.

The Cd<sup>II</sup> atom in the title complex, [Cd(C<sub>12</sub>H<sub>27</sub>O<sub>3</sub>SSi)<sub>2</sub>(C<sub>3</sub>H<sub>4</sub>N<sub>2</sub>)], is penta-coordinated by two O and two S atoms from the *O,S*-chelating silanethiolate residue and one pyrazole N atom in a distorted geometry that is slightly closer to trigonal-bipyramidal than to square-based pyramidal. The pyrazole ligand is stabilized within the complex by an intramolecular N—H···O hydrogen bond. One of the *tert*-butyl groups is disordered over two orientations with occupancy ratio of 0.534 (6):0.466 (6).

**(1*H*-Pyrazole- $\kappa$ N)bis(tri-*tert*-butoxysilanethiolato- $\kappa^2$ O,S)cadmium**

Katarzyna Baranowska, Mateusz Bulman and Anna Dołęga

**S1. Comment**

Our current research subject concerns the structural and spectroscopic characteristics of simple inorganic complexes - models of the catalytic site of the enzyme alcohol dehydrogenase. We use tri-*tert*-butoxysilanethiol as a source of thiolate function and aromatic N-ligands as histidine analogs (Dołęga, 2010 and references therein)

The title complex is the first heteroleptic cadmium(II) tri-*tert*-butoxysilanethiolate with the pyrazole co-ligand. The NH group of pyrazole ligand forms an intramolecular hydrogen bond with oxygen and there are no other strong intra- or intermolecular interactions in the crystal other than van der Waals. Therefore with regard to the crystal packing the title compound resembles rather analogous pyridine-containing zinc and cadmium complexes than imidazole-containing analogs (Dołęga *et al.*, 2005; Dołęga *et al.*, 2006; and Dołęga *et al.* 2009). The coordination geometry is in between square-base pyramidal and trigonal-bipyramidal, but closer to the latter based on the calculation of the  $\tau$ -parameter (0.597; Addison *et al.*, 1984). The cadmium-ligand bond distances are comparable to those found in similar complexes (Dołęga *et al.*, 2008; Dołęga *et al.*, 2009). However, the single intramolecular NH $\cdots$ O hydrogen bond introduces further asymmetry into the molecule, including the bond lengths (*i.e.* Cd—O1 and Cd—O4, see Table 1). The title complex features a characteristic, large ( $> 140^\circ$ ) S—Cd—S angle, and an O—Cd—O angle close to  $180^\circ$ .

The molecular structure of (I) is shown in Fig. 1 and a crystal packing diagram is presented in Fig. 2.

**S2. Experimental**

Compound (I) was crystallized at low temperature (255 K) from toluene-methanol solution of cadmium bis(tri-*tert*-butoxysilanethiolate) (synthesis described in Pladzyk *et al.*, 2011) and pyrazole.

**S3. Refinement**

All C—H hydrogen atoms were refined as riding on carbon atoms with methyl C—H = 0.98 Å, aromatic C—H = 0.95 Å and  $U_{\text{iso}}(\text{H})=1.2 U_{\text{eq}}(\text{C})$  for aromatic and  $1.5 U_{\text{eq}}(\text{C})$  for methyl groups. Atoms C10—C12 are disordered over two positions (0.534 (6)/0.466 (6)). The hydrogen atom involved in the intermolecular hydrogen bond, H2, was freely refined.

**Figure 1**

A view of the molecule of (I), showing the atom-labelling scheme. Displacement ellipsoids are drawn at the 30% probability level and H atoms have been omitted. Hydrogen bond indicated with dashed lines. Only the major conformation for the disordered *tert*-butyl group (C10—C12) is shown.

**Figure 2**

Crystal packing of the title compound. Hydrogen bonds are indicated with dashed lines.

**Geometry.** All s.u.'s (except the s.u. in the dihedral angle between two l.s. planes) are estimated using the full covariance matrix. The cell s.u.'s are taken into account individually in the estimation of s.u.'s in distances, angles and torsion angles; correlations between s.u.'s in cell parameters are only used when they are defined by crystal symmetry. An approximate (isotropic) treatment of cell s.u.'s is used for estimating s.u.'s involving l.s. planes.

**Refinement.** Refinement of  $F^2$  against ALL reflections. The weighted  $R$ -factor  $wR$  and goodness of fit  $S$  are based on  $F^2$ , conventional  $R$ -factors  $R$  are based on  $F$ , with  $F$  set to zero for negative  $F^2$ . The threshold expression of  $F^2 > 2\sigma(F^2)$  is used only for calculating  $R$ -factors(gt) *etc.* and is not relevant to the choice of reflections for refinement.  $R$ -factors based on  $F^2$  are statistically about twice as large as those based on  $F$ , and  $R$ -factors based on ALL data will be even larger.
